Purity:	99.68%	MOQ:	100pcs each name
Delivery Time:	Within 24 Hours After The Payment	Brand:	Bodybiological

#### Description

Metylenolone, or metylenolone, is an and anabolic (AAS) drug that is primarily used to treat anemia caused by bone marrow failure. It is given by injection into a muscle. Although it was widely used in the past, this drug has mostly been discontinued, so it is mostly no longer available now. A related drug, metenolone acetate, is taken orally.

Side effects of methenolone include virilization symptoms such as acne, increased hair growth, voice changes. The drug is a synthetic and anabolic, and therefore an agonist of the receptor (AR), the biological target of such as and (DHT). It has moderate anabolic and weak effects, and no estrogenic effects or risk of liver damage. Metylenolone p-nanate is a methenolone ester, a long-acting prodrug of methenolone in vivo.

Metylenolone was introduced for medical use in 1962. In addition to its medical uses, metylenolone is also used to improve physical fitness and performance.

#### Application

Since Metylenolone is a mild DHT, it is unlikely to have many muscle gains as it is not characterized for this purpose. But you can still use it during muscle building, and you may need a larger amount to see obvious results.

Metylenolone is the first choice for most bodybuilders during the fat loss period. Metylenolone is not only beneficial to fat loss during the preparation period, but also can better protect your muscle tissue.

The biggest benefit of Metylenolone is its safe nature, almost all in women have serious complications, but Metylenolone is well tolerated by women. Masculinity is the biggest problem for women who use. And women don't have to worry about this problem when using Metylenolone, so Metylenolone is very popular among female athletes
