Mestanolone is the 17 α -methylated version of dihydDHT). The systematic name of mestanolone is: 17 β -hydroxy-17 α -methylandrost-3-one. It is an orally bioavailable androgen that is highly anabolic while only slightly anabolic. It is incapable of aromatization and is not an agonist of the progesterone receptor.

Use for chronic wasting disease, osteoporosis, severe infection and trauma, burn, etc caused by the negative nitrogen balance, promote the growth of premature infants and immature, etc. The fracture is not easy to heal, hypercholesterolemia and postpartum depression can also be used.

Applications:

1. Mesterolone is an orally applicable androgen and dihydrotestosterone (DHT) derivative. it was used with some success in controlled studies of men suffering from various forms of depression.
2. Mesterolone is a relatively weak androgen and rarely used for replacement therapies.
3. Mesterolone widespread use in bodybuilding primarily for activity in anabolic stacks but such use has declined after introduction of aromatase inhibitors and SERMs
